Purchasers can usually download a free scanned copy of the original book (without typos) from the publisher. Not indexed. Not illustrated. 1887 edition. Excerpt: . . . pds2, where ds is the element PQ of the arc in Fig. 13, and ds dr sec p, sin pr, where p is the angle PQP, namely, the angle which the radius vector makes with the curve. If we put p r sin p in the above, we get 8ijrta. njdr. (10) These formulae are of considerable use in cases in which the curve is such that p and r are connected by a simple relation. For example, let us consider the involute of the circle. Let P be a point on the involute, then the tangent PT to the circle is the normal to the curve; so that we have p2 r-a2, where OQ p, OP r, OT a. p if the area be measured from the line OA, where A is the point where the involute meets the circle. Examples. 1. Show that the sectorial area of the curve r a b sin , measured from a tangent drawn from the origin, is ab sin2 cp V1 (-sinp cos p). 2. Show that the sectorial area of the curve r1 a2 sin , measured from a tangent drawn from the origin, is JsW40. 3. To find the area of the epicycloid. In this case, we have r (m 1) gives r aW98sin2fl, S sin29 (m--l)3 J -7 rj-(9-sin f l cos 9), (m--iy if the area be measured from the fixed circle. Hence, taking e x, we find that the area between...
